

RYAN MILTON

Senior Software Engineer

Kent, WA • mr.ryan.milton@gmail.com • (425) 905-0666
linkedin.com/in/mrryanmilton • github.com/Ryan-Milton • ryguy.dev

Senior full-stack engineer with 7+ years shipping consumer and industrial products at Meta, Anduril, and Groupon — most recently architecting real-time streaming, AI chat, and AR experiences for Meta's Aria Smart Glasses. US Navy veteran with a track record of leading teams, mentoring engineers, and owning features from design through production launch.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL

Frameworks & Libraries: React, React Native, Next.js, Node.js, Redux, Relay/GraphQL, Tailwind CSS

Real-Time & Devices: WebRTC, MQTT, Bluetooth Low Energy (BLE)

Databases: MongoDB, SQL & NoSQL data stores

Cloud: Google Cloud, AWS, Microsoft Azure

Tools: Claude Code, Cursor, VS Code, Git, GitHub, Postman, Android Studio, Xcode

EXPERIENCE

Senior Software Engineer | Meta (Contract) October 2024 – Present

- **Architected and shipped end-to-end WebRTC real-time streaming** for Aria Smart Glasses' Remote Expert feature — building the full-stack implementation from Redux state management and persistence through streaming orchestration and parameters UI, enabling live video assistance for glasses wearers.
- **Led the Aria AI Chat UI overhaul**, redesigning the experience with dedicated Phone/Glasses surface tabs, structured tool-call visualization (live stepper pattern), date-separated threads, and scroll-back pagination — resolving multiple launch-blocking bugs and shipping to production.
- **Built the AR Fitment scanning and ordering flow** for Aria Gen 2 glasses — the complete scan-to-order pipeline, error escalation with fallback methods, Gen 2 ordering system integration, and AR_SIZING tracking — enabling properly fitted frames without in-person measurement.
- **Redesigned the AI People “Name Tag” feature** with a keyboard-anchored naming interface and updated onboarding flow, while diagnosing and fixing critical white-screen crashes that blocked user activation.
- **Improved companion app UX and platform stability** — custom in-app notification banners and Toasts, redesigned profile settings, Gen 1 recording profile compatibility fixes, and BLE optimization that throttled redundant recording fetches to reduce device congestion.

Senior Software Engineer | Anduril Industries February 2023 – June 2024

- Built “Forge,” a manufacturing application guiding technicians through equipment assembly, used by [50+ technicians across 4 production lines to improve build accuracy and throughput.
- Integrated TeamCenter PLM with a Remix front end, cutting document access, editing, and approval time for manufacturing engineers.
- Led Tailwind CSS adoption and built a shared component library for the Internal Tools team, standardizing UI across 3 internal applications and reducing duplicate component work.
- Proposed and drove adoption of a design system for internal applications, improving consistency and speeding new-feature UI development.

Lead Front-End Engineer | HealthBridge Financial July 2020 – January 2023

- Re-architected the client-facing web application end to end; promoted to Front-End Lead after one year.
- Drove test coverage across three front-end applications from 0% to 70%+, reducing regressions in production releases.
- Mentored engineers across US and overseas teams, including onboarding, code review standards, and career development.

Full-Stack React Native Engineer | Buddy Technologies (Contract) February 2020 – April 2020

- Key developer for releases of the Smart and Connected Airstream apps, enabling owners to remotely monitor and control their vehicles across iOS and Android.
- Integrated Azure MQTT for secure, real-time device-to-cloud messaging, and built robust Bluetooth and network device interfaces with minimal latency.

Full-Stack/Front-End Engineer | Groupon (via Insight Global) August 2019 – February 2020

- Key contributor to launching Reserved Seating for AMC Theaters across all Groupon platforms.
- Trained incoming engineers on Groupon's technologies and frameworks while absorbing senior-level ownership as the team transitioned.

PROJECTS

Knosys — Local-first personal knowledge management app knosys.sh

- Designed, built, and shipped a privacy-first knowledge management application (“Offline by default. Private by design.”) — owning product strategy, UX, and full-stack implementation solo.
- Architected Markdown-first local storage with SQLite full-text search and optional end-to-end encrypted sync across Electron/React desktop and native SwiftUI iOS clients.

Eagle Eye — Real-time geospatial intelligence dashboard github.com/Ryan-Milton/Eagle-Eye

- Built a React/TypeScript, Mapbox, and Bun/WebSocket dashboard that normalizes and streams 15+ live aviation, maritime, satellite, weather, conflict, cyber, and news sources into one operational view.

Klipt — Native macOS clipboard history utility github.com/Ryan-Milton/klipt

- Building a native Swift/AppKit menu-bar utility with encrypted local clipboard history, reusable snippets, and global hotkeys; AES-GCM data uses a per-install key stored in macOS Keychain.

EDUCATION

Code Fellows, Seattle, WA — Certificate, Advanced Software Development in Full-Stack JavaScript (December 2018)
